Since Strategic Treasurer was founded in 2004, we have helped hundreds of corporate clients face real-world treasury issues. Our senior consultants have practical, hands-on experience in corporate treasury environments and have held senior management and leadership roles across numerous industries. Strategic Treasurer's consultants are known not only for their expertise in the treasury space, but also for their responsiveness to client issues, comprehensive follow-through on every project, and deep understanding of the industry. Our focus as a firm centers on maintaining true expertise in the treasury space, which is accomplished through a combination of annual industry surveys, an ongoing discovery program, and active engagement with both corporate clients and treasury technology vendors. As a result, our awareness of the market is both global in scope and rich in detail.

Why is this Report Necessary?

Treasury technology has become a critical function within the financial environment. Whereas the first treasury management systems (TMS) were too expensive for most organizations and offered only limited functionality, the industry has evolved significantly since those early days. Today, the treasury and risk management systems (TMS) used by hundreds of thousands of practitioners that are available to organizations of all sizes, at a variety of costs, and with a broad range of functionality that spans both cash management and payments to sophisticated risk management and analysis.

While this widespread growth in the technology market has alleviated many of the operational hurdles the industry once faced, such innovation

has not come without their own share of challenges. In fact, many treasury and finance practitioners believe that technology is a major source of headache and confusion. Whether it's selecting the right vendor, training staff on how to use the system, or integrating the TMS with other solutions, there are a number of areas where treasury can experience technology related difficulties or frustration. And as treasury technology continues to see greater use within the industry, these problems are increasingly multiplying. The reality is, companies across the globe

In order to tell practitioners as they seek to understand and ultimately leverage treasury technology, this analysis report aims to provide a thorough overview of the TMS space. This

includes insight to the various types of treasury technology that exist today, an overview of the primary functionality offered through modern day solutions, and an analysis of the key challenges to consider as treasury technology is implemented. Finally, this report will provide analysis on some of the leading TMS vendors currently operating within the space, including each company's market position, product set, customer service division, and global footprint.

Our hope is that industry practitioners can leverage this report to further their knowledge of the treasury technology landscape and ultimately make more informed and effective decisions regarding their use of a TMS. We hope you enjoy this report and find it useful. Thank you for reading.

Treasury Technology is a Source of Confidence

Treasury technology has truly become an integral component of every practitioner's daily lives. Innovation, efficiency, security, their use and ongoing development are a significant source of confidence for treasury managers given the pace of innovation and change that is occurring today.

Treasury Needs Access to Up-to-Date Information

A TMS implementation typically takes nothing less than six months from a decision to go live five years ago. Given that most companies utilizing a TMS have been running since around 2005, practitioners need access to the latest data and insights in order to make accurate and informed decisions.

What This Report Offers

This report provides practitioners with a comprehensive view of treasury technology with a focus on treasury and risk management. TMS, TMSaaS, current challenges, tools, and usage rates are analyzed along with the coverage of some of the leading companies operating in the space today.

TMS Development Overview

While treasury management systems (otherwise referred to as "TMS") have been around for decades, the transformation that has occurred in the space over time has resulted in today's solutions being significantly different than the first offerings. When the first TMS originally referred to as a treasury application or "TAS" were introduced in the 1960s, financials had just begun to be digitized, and many treasury operations were still paper based. At the time, focus was on funds transfer capabilities, integrated with liquidity risk processing, and liquidity management, were the primary functions offered. Although these original solutions were often costly and less capable for most organizations, they still represented a massive breakthrough in the financial technology

space and served as the cornerstone for further development within the treasury software arena.

In the years following these first offerings, a number of innovations occurred within the space. Of these developments, perhaps the most significant was Microsoft Excel. Excel was introduced as a spreadsheet client application that provided users more advantages over paper based processes. Due to its low cost and significant value add, Excel quickly became the go-to tool for treasury and it continued to be the use of the leading applications in use by organizations today. Beyond Excel, technological advancements including widespread use of the internet and the introduction of cloud based or "SaaS" technology also helped drive additional

growth within the TMS space. Over time, as office of new entities and products led to the expansion of functionality to address everything from cash management and payments to automated risk management, risk modeling, forecasting, and all manner of treasury related solutions.

Since the early 2000s, the rapid influx of new TMS vendors to the space has allowed for the development of a broad range of available service options and business models. This "democratization" of technology has enabled the marketplace where small and mid-sized enterprises (SMEs) of the world to Fortune 500 companies are provided with treasury solutions that offer the breadth of functionality they require at a cost that matches their budget.

STARTING OUT

The first TMS solutions were introduced in the 1960s. These solutions had limited functionality and tended to be expensive only for large multinational organizations.

GROW & THE WEB

Growing use of Excel and the internet led to increasing web based treasury operations. TMS solutions are addressed, development and market as new services and modules are added.

SAAS PLATFORMS

The introduction of SaaS technology leads to broad development of the TMS space, with cost effective, flexible, and configurable solutions available for organizations for all sizes.

DEMOCRATIZATION OF TECHNOLOGY

Continued high level growth in the 1990s space has contributed to a marketplace with dozens of providers and hundreds of solutions. Functionality and cost vary widely across the full spectrum of options.

CURRENT INNOVATIONS

Moving forward, the use of cloud solutions, coupled with the growing democratization of TMS, AI, automation, and mobile access, will continue to have an impact on the treasury technology space.

The Treasury Technology Landscape

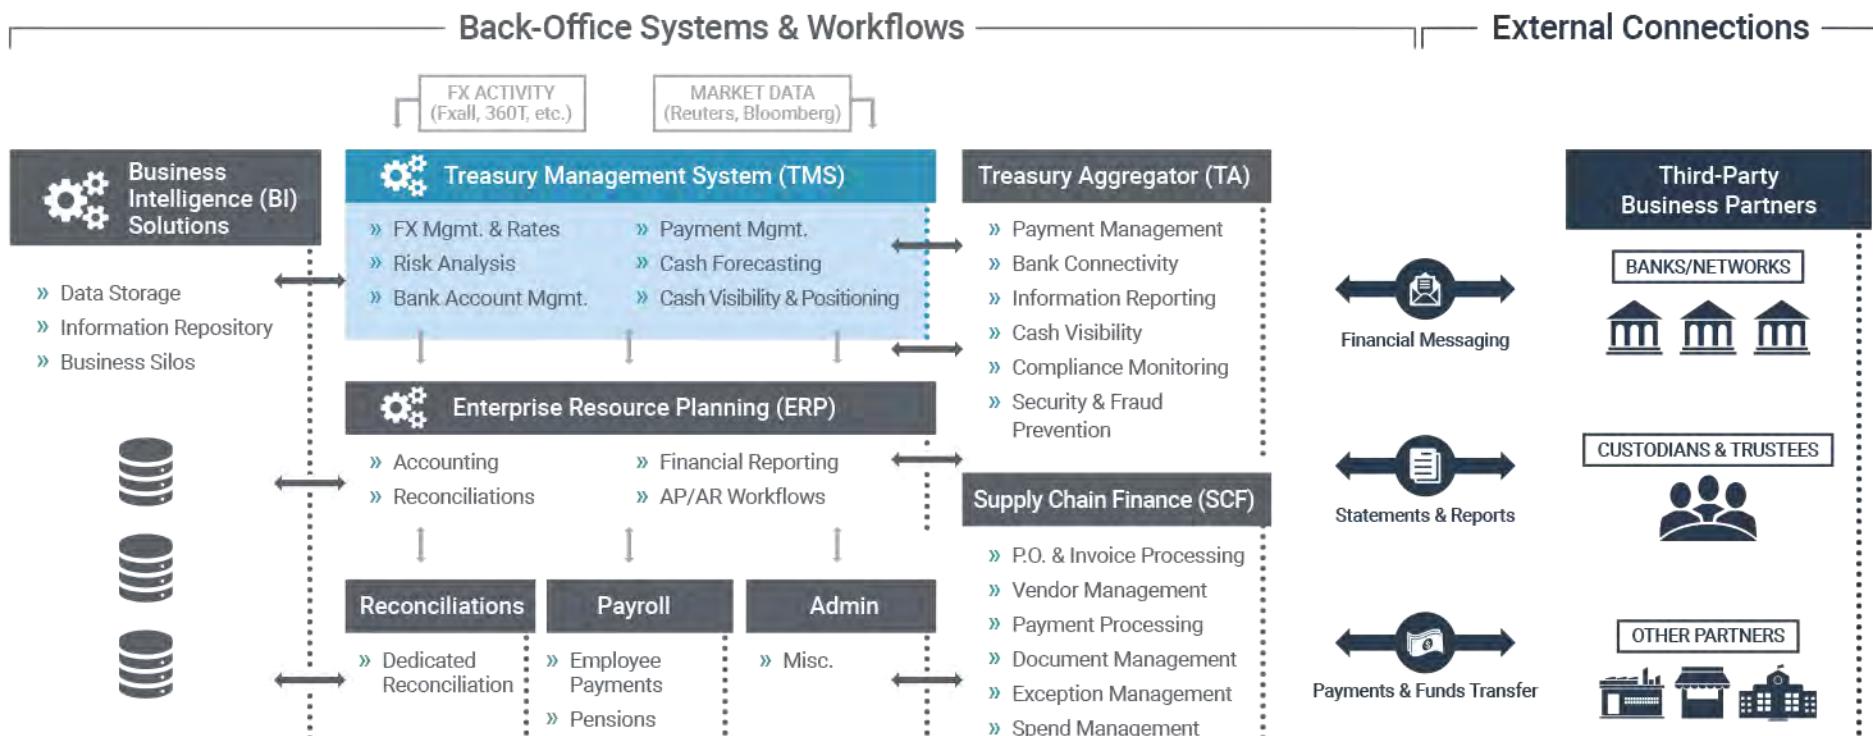

ENTERPRISE VIEW

As treasury evaluates the use of a TMS, they must keep in mind how the solution will fit into their broader technology stack. They must also consider what functionalities the TMS will perform relative to their other systems. Configuring the capabilities of each system to function alongside the others can be quite complex, especially considering the broad range of technology solutions that currently exist within the market and that could be installed within an organization. Today, the financial technology

(fintech) landscape consists of hundreds of vendors and thousands of available solutions. While many of these solutions are specialized in areas such as compliance or reconciliations, there are other more comprehensive solutions that address the full scope of finance or treasury operations. Such technologies may be installed directly at the client site, hosted externally via a cloud (SaaS) platform, or even downloaded onto a mobile device. Depending on the level of functionality purchased, system use may be limited to just a few employees or span numerous departments and hundreds if

not thousands of employees internally. While the unique technology environment of any organization varies, the graphic below provides an overview of a potential configuration for a larger, complex corporation. The graphic depicts the various types of systems that could be used to drive efficiency and automation, and provides an overview of key functionalities addressed through each solution. Additionally, the role of a TMS is highlighted here for purposes of emphasizing its position within an organization's broader technology stack.

SAMPLE TECHNOLOGY INFRASTRUCTURE

TMS VIEW

While the previous page provided an overview of the broader technology landscape, this page focuses specifically on the functionalities provided through TMS offerings. The TMS landscape is broken down by functional modules. These modules identify six primary service areas or sectors that a participant will likely need to cover. These services include cash management, payments, compliance and security, FX management, risk and investment activity and risk management. In most circumstances, a TMS will offer a degree

of cash management functionality (relative to bank balances, positions) and then will build additional services and modules based off these functions. This is because cash management is by far the most commonly used and utilized functionality for treasury departments. Due to the costly, cash management often serves as the core framework from which additional TMS functionality extend while very few solutions specialize in the cash management area. Others may focus on activities such as payments, risk, or compliance. Across the full spectrum of providers, the unique mix of functionality

offered can vary greatly. For instance, one vendor may offer specialized cash management and payment components, but not include any functions related to risk or FX trading. On the other hand, some vendors may offer general cash management and payment services, but expand the scope of their offering to include risk, risk, and compliance functionality. As the array of services offered through each vendor and solution varies, treasury should truly evaluate each provider to determine which mix of functionality most adequately address their unique requirements and set of needs.

TREASURY TECHNOLOGY LANDSCAPE

Who Needs a TMS?

For some practitioners, it may be difficult to identify a situation where leveraging a TMS would prove useful. To address this, the following list offers several examples of when and how a TMS could simplify or enhance treasury operations.

- YOU HAVE GROWN RAPIDLY AS A COMPANY AND REQUIREMENTS DON'T COVER SATISFY YOUR OPERATIONAL REQUIREMENTS.**

It's common to continue adding on to their departmental silos so that business personnel can manage the needs of their respective units independently. This is usually a less effective option at the outset, but as companies grow, the complexity inherent in their financial operations tends to increase with them. Some bank accounts and customers can be less important than others, giving rise to a lack of focus out of those changes. This ultimately leads to an inability to make informed decisions about their banking. Back to the original example of providing additional liquidity because what it cost others, companies take notice of a company's failure at this position. It is the inevitable result of continued growth.

- YOUR TREASURY TEAM IS OVERSTAFFED & YOU NEED ADDITIONAL AUTOMATION.**

It's also natural that many treasury teams are over staffed, with many members of the organization having little to no real responsibility. In this situation, automation should prove extremely beneficial to give an impression of added competence, and the automation will reduce risk in the treasury department. When most of your professionals today believe that they don't have to perform at their very best, in these situations leveraging a TMS to automate these unnecessary processes for payment processing can free up valuable time for treasury and allow them to focus on more strategic operations.

- YOU ARE USING DISPARATE SYSTEMS TO PERFORM CERTAIN TREASURY FUNCTIONS & WOULD LIKE TO CENTRALIZE THESE OPERATIONS THROUGH A SINGLE SYSTEM.**

Whether it's due to multiple mergers and acquisitions, or the result of an M&A deal, there are often many systems within that institution. In the interest of saving about technology costs, some companies will opt to keep the separate systems, but that has become less common as technology advances and more and more find a way to merge all operations through a centralized technology platform. In these instances, banks will typically either build a new system or buy one, either with their existing providers or choose to work with a third-party solution to use open-source architecture or other ancillary software offerings.

- YOU ARE FACING AN INCREASED THREAT FROM FRAUD & HEIGHTENED SECURITY EXPECTATIONS INTERNAL & EXTERNAL.**

While security and fraud prevention may not have been a primary focus for treasurers previously, the past few years is seeing a recent surge in security awareness, especially as the threat of ransomware increases for practitioners who handle money. These threats can come in many forms, such as viruses, malware, and trojans, and can affect a TMS or serve as a means for bypassing treasury controls and rules. With many TMS vendors having a robust security track record, it's important for a treasurer to be aware of these factors, any changes that have been recent security concerns, or if a TMS vendor has a greater control over their operations.

How Does a TMS Optimize Treasury's Operations?

DATA CENTRALIZATION: A SINGLE SOURCE OF TRUTH

Today, there is no single responsibility or task that treasury is called upon to perform. Instead, there are a range of functions, from cash positioning and funds transfers to strategic hedging and risk management. But treasury managers find given that many treasury professionals at companies have five or six responsibilities, one opportunity for treasury is to leverage technology to optimize and automate these tasks where the demand grows.

Providing these efficiencies gains is where the modern-day TMS has proven particularly effective. By enabling practitioners to manage the entirety of their operations through a single platform, the result is that a single instance of data can be used to inform multiple areas of operations at once. For instance, knowing bank metrics regarding global cash inflows can be used to generate cash forecasts, update risk exposures, allow P&L hedging strategies, and allow practitioners to make strategic decisions regarding the use of existing capital. This level of automation, as represented by

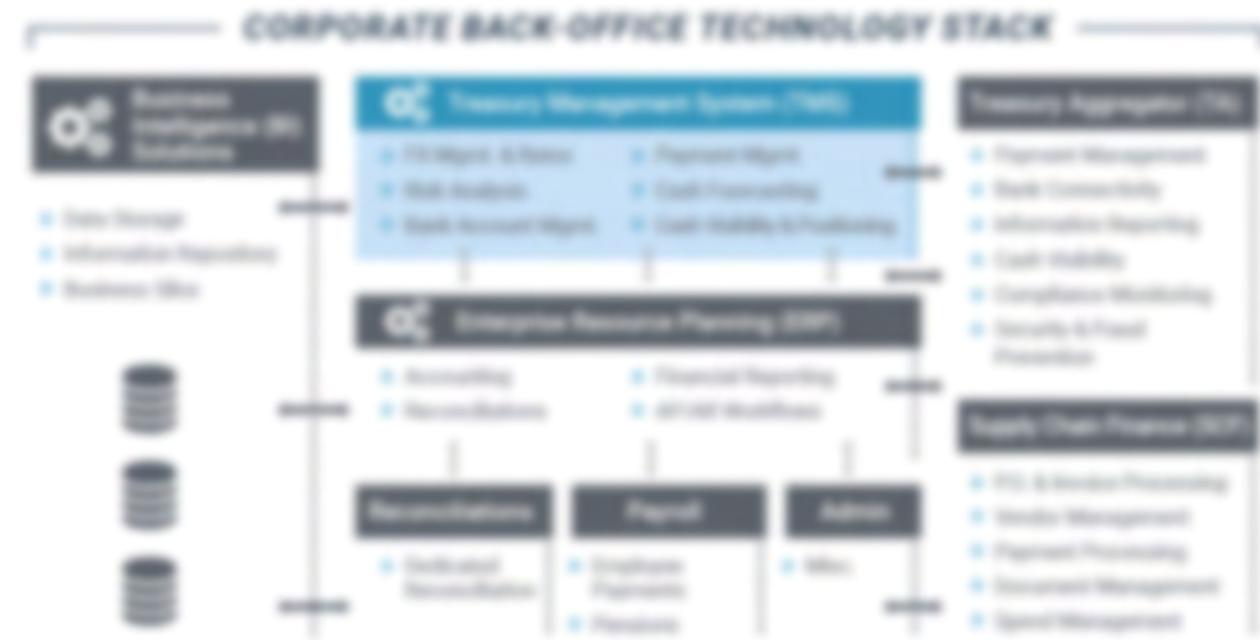

a workflow where treasury has to pull cash balances and imports from multiple bank portals and then individually update each spreadsheet or extract information which provides unnecessary time savings and ultimately significant cost savings as well. In an environment where 50% of treasurers do not have time to perform all their daily tasks, this form of efficiency can be the driving force that allows treasury to quickly complete daily operational functions, then turning its time to focus on strategic analysis and planning.

BACK-OFFICE INTEGRATION & STP

Developing a technology stack that allows for the quick and easy flow of data is much easier said than done. From a company's point of view, the use of multiple vendor specifications or documents for managing workflows and tracking financial information can introduce significant confusion early on. And as organizations grow, older information hubs become a more common source as new technology solutions are added but never fully integrated with existing systems. For organizations operating with an ERP or APIS along with a BI solution and potentially other systems for accounting, assets, cash flows, and compliance, keeping track of where information is stored and how it is disseminated can become overwhelming.

While the impact that a TMS will have on efficiency depends largely on the ability of a company to properly integrate it with their other solutions, a company's implementation can prove considerably advantageous not just for treasury, but for the organization at large. As each business unit relies upon the others for information, the ability to quickly disseminate reports and data from a TMS to another system (potentially a bank held and now more robust) that all departments have access to the information they need to effectively operate. In recent years, fintech vendors have been able to leverage standard sets of APIs and other connectivity protocols to integrate their solutions with one another and with bank-held user providers much more efficiently and efficiently.

CONSIDERATIONS FOR TREASURY

- Which system collects which type of data?
- Where and how is data ultimately stored?
- What systems need to be integrated?
- How often is data transferred between systems?

RATIONALIZING THE BACK-OFFICE

Q1	Q2	Q3	Q4
Modern Day Tech Stack	Disaggregating Data	Rationalizing the Back-Office	Standard APIs Can Help
With the rise of fintech, many companies have moved away from legacy systems and towards a modern day tech stack. This includes using cloud-based solutions for various parts of their operations, such as accounting, procurement, and supply chain management. These solutions often offer better integration and collaboration across different departments. With the rise of fintech, many companies have moved away from legacy systems and towards a modern day tech stack. This includes using cloud-based solutions for various parts of their operations, such as accounting, procurement, and supply chain management. These solutions often offer better integration and collaboration across different departments.

STREAMLINING EXTERNAL CONNECTIVITY

External connectivity considerations for treasury include integration with bank customers or networks such as SWIFT, instant data providers like Bloomberg, and TMS partners including SWIFT or TMS. At this point in time, many of the leading TMS solutions incorporate integrated external connectivity to these sources so that information can pass seamlessly into their platform for analysis and reporting. In recent years, vendors, banks, and external data providers have been able to leverage standard sets of APIs and other mechanisms

connectivity protocols to integrate their solutions with one another more effectively and efficiently.

For bank connections, treasury's considerations will vary depending on the unique uses of connectivity options like SWIFT, bank portals, direct API's, and so on. In the case of banks, they must maintain connectivity with, given the breadth of their connectivity demands and interests, bank connectivity has become a critical consideration for firms when selecting a TMS and subsequently as a major area of focus for TMS providers. Today, the leading TMS solutions have often partnered with specialists in bank connectivity

(see Treasury's approach) or have built out the required functionality in their own so that the full scope of connectivity demands and interests can be addressed without requiring multiple systems, conflicting bank transmission processes, or other disparate solutions. Although a fair amount of work and cost is usually incurred during the implementation phase that integrates external transaction and analytical integration in functioning products, any connection with multiple bank connectivity and market data/TMS requirements should benefit customers by leveraging a TMS that can automate these functions on their behalf.

STREAMLINING EXTERNAL CONNECTIVITY

BACK-OFFICE ARCHITECTURE

EXTERNAL CONNECTIONS

TMS External Systems Integration

Some TMS solutions have built out more robust features and management functionality that manage all connectivity solutions to funds and entities, as well as to instant data providers, TMS trading partners, and external portals. The top TMS solutions integrate these external solutions transparently into their architecture to the extent that all funds and funds managers can be connected directly through that portal, and all subsequent transactions, reports, and analytical features are available in one place across the platform.

What Are Instant Data Providers?

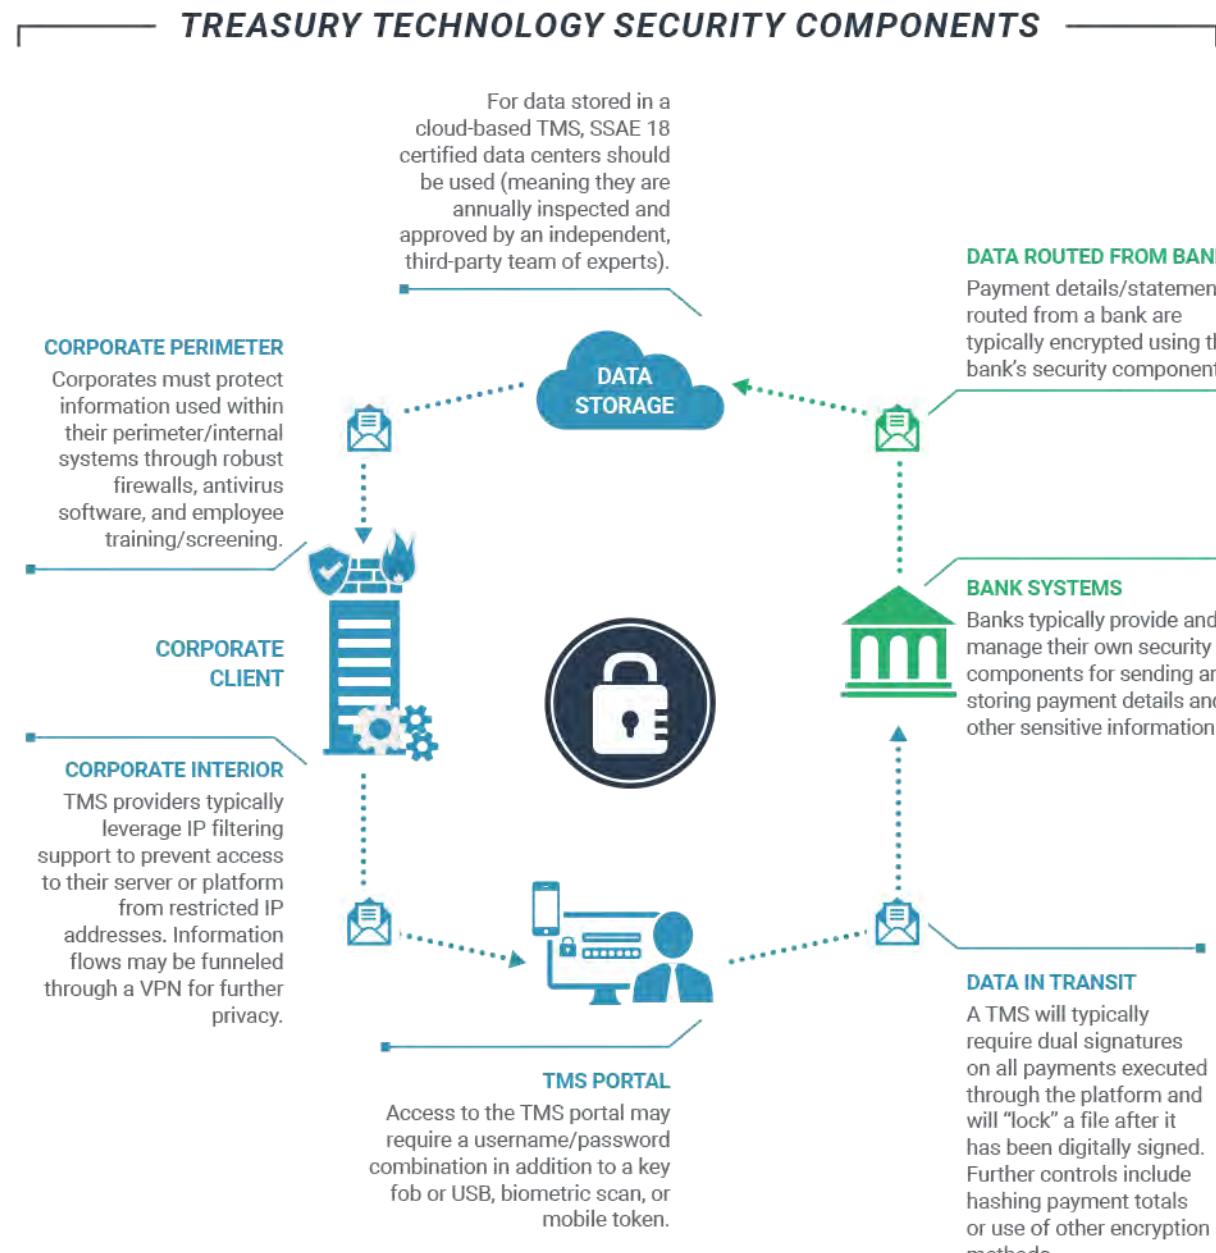

Most treasury and financial services organizations provide a range of data feeds from multiple sources, including bank transactional activity and external partners, having to manually pull this information and then take it for confirmation, reconciliation, and risk monitoring.

ENHANCED SECURITY & CONTROL

In recent years, the emphasis placed on security controls, particularly within the fintech arena, has escalated significantly. As fraudulent activity remains at high levels, protecting information in transit to or from a bank, as well as information that is stored internally in a TMS or related network/server, is of utmost importance. TMS vendors address these concerns in several ways. First, they must secure access to the platform itself. This is typically done by leveraging IP filtering support that restricts access to the server from unauthorized IP addresses, and by requiring the use of tokens, such as a key fob or USB drive, for users signing into the system. In recent years, the use of biometrics (i.e. fingerprint or retinal scans) has also seen increased use. In many circumstances, these techniques are leveraged together to create a multifactor authentication (MFA) process where TMS users must present a key fob or biometric scan in addition to a password/username to gain access to the system.

In addition to securing access to their network, a TMS must also protect information exchanged with banks and other external parties. To secure these workflows, most vendors will hash totals on payment information – a method of identifying any anomalous changes to values or account numbers that occur while messages are en-route to banks. Vendors may also require that payments over a certain amount (or all payments in general) have two signatures before being processed. As information flows to other internal systems, vendors may utilize a SSH File Transfer Protocol (SFTP) connection that is funneled through a virtual private network (VPN).

Navigating Your TMS Implementation

DEPARTMENTAL ALIGNMENT

It can be incredibly difficult to secure funding and support for technology implementations. When negotiating with a limited budget, treasury often finds that they must compete with other departments and at such, must develop a strong and effective business case to win over executives and other stakeholders. In these competitive environments, treasury's technology requirements may take a back seat to other projects.

Typically, it is easier when the implementation of a dedicated treasury solution is seen as an unnecessary expense. However, this is not the case. Instead, the implementation of a TMS will provide benefits not only to treasury, but also to accounting, IT, and financial executives.

When it comes to financial technology, the needs and requirements for each business unit will vary. However, in order for each department to obtain the information they need, each group's back office workflow must be closely interconnected. For instance, accounting will need access to transactional information and data regarding the organization's various cash flows for purposes of recording budgets and creating financial reports. Other business units have payments activity; a large portion of this information will come from banking, loan, and supplier systems. However, this information does not just appeal to treasury all on its own. Rather, business units spend large portions of their time gathering this data and most often manually pull statements from bank portals and other external sources. If a

dedicated solution for managing and automating these workflows has not been adopted,

Given the extent to which treasury is relied upon to provide financial information to other internal stakeholders, the simple truth is that addressing the methods by which treasury can receive cash positions and market data will ultimately enable accounting and other departments to more easily obtain the data they need. And if this is the best way to accomplish this, then the implementation of such a solution will ultimately benefit each group that relies on treasury for information. To emphasize this point internally, treasury should be prepared to communicate accurately with accounting, IT, and executive reporting their needs and how such needs can be better addressed through enhanced technology.

WINNING SUPPORT FOR TREASURY TECHNOLOGY INITIATIVES

Include Other Stakeholders

To fully prove value for your project, non-treasury stakeholders, be proactive in engaging with other departments to identify what in effect the new project solution will cover the requirements of accounting, IT, executives, etc., rather than only focusing on treasury operations.

Work to Overcome Shared Obstacles

As other departments determine the requirements that they believe treasury needs to document these challenges and work to identify areas through which the project will address the issues.

Demonstrate Clear Value-Add

Given the needs of other departments will likely need to be prioritized, demonstrating how the new solution will address those needs, such as providing automated tools for financial reports, streamlining workflows for recording expenses and accounting activities, etc.

Build Consensus & Understanding

Once it may be enticing for treasury to offer a "black box" solution to stakeholders in an attempt to increase support, these efforts can lead to a lack of project implementation, significant difficulties or cost over-budget.

STANDARD PROCESS WORKFLOWS

Given the broad set of challenges that can manifest themselves within a technology implementation, great care must be taken during the planning and development stages to ensure that business is prepared to handle unexpected outcomes. One key factor in this area is to provide detailed guidance for managing certain risks and avoiding bad decisions so that if a situation has been fully thought through, the correct outcome can still be achieved and all subsequent steps can still be completed as planned. Specifically, treasury

should work to identify any tools or processes that will take considerable time to complete and intentionally stagger their placement within the roadmap so that all the complicated steps are not being undertaken at the same time.

A standard technology implementation can normally be segmented into a set of distinct phases. Standard treasury defines the process using a five step methodology with each step further subdivided into a unique set of procedures and tasks.

The steps contained in this approach include:

- Assess
- Select
- Architect
- Implement
- Optimize

This approach begins with project planning and includes a post implementation "monitoring and maintenance" phase that involves ongoing checks and evaluations of the technology to ensure all components continue to function at optimal levels. The graphic below provides a more detailed overview of these steps and the individual sets of procedures that comprise them.

TREASURY TECHNOLOGY IMPLEMENTATION: PROJECT STAGES

GETTING UNREALISTIC TIMELINES

While treasury may feel pressure to deliver a timely and effective implementation, they must be careful not to compromise and underestimate what it is necessary for practitioners to set achievable deadlines and to everything in their power to provide the time to "go live". The reality is that many implementations take much longer than anticipated. And although this does not automatically make the project a failure, such delays can impede treasury's ability to focus

on other tasks, drive up implementation costs, and negatively impact their credibility with other departments and with executives as the project drags on. For this reason, treasury should strive to be realistic and conservative with the timelines they set and avoid promising a timeline internally that requires a team move to highly sensitive matters. The truth is, these timelines are rarely adhered to.

The extent to which technology implementations can take longer than expected was highlighted in a recent Deloitte Treasury survey. As part of this

survey we asked practitioners that had undergone a TMS implementation to indicate how long they expected the process to take versus how long it took actually. The results obtained through this survey clearly demonstrate the degree to which the timelines for TMS implementations are underestimated. Given this reality, it is evident that treasury needs to take a step back when evaluating their implementation and consider all the risks and potential obstacles that could arise. This information can then be used to establish a realistic and achievable timeline.

Q Corporates: How long did the implementation process take? (Expectation vs reality)

WHERE ARE THE PAIN POINTS?

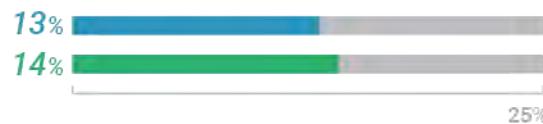

Over the full course of a TMS implementation, there are numerous areas where delays can quickly spring up. From training employees and onboarding banks to testing the solution and adding additional modules, the ability for treasury and for the organization at large to

stay on track without adding costs requires careful planning and strategic oversight. In a recent survey of treasury professionals, we asked respondents who had undergone a TMS implementation to indicate what they expected the largest challenge to be, compared to what the largest challenge was in reality. The data obtained through this research provides a unique look

into the diverse set of issues that practitioners may have to address during a technology implementation. The reality is that issues can quickly arise out of multiple areas and as such, treasury must be prepared to handle a diverse set of obstacles. The graphic below provides an overview of the aforementioned data regarding treasury's TMS implementation experiences.

Q Corporates: What was the biggest challenge associated with your implementation? (expectation vs reality)

Taking Longer Than the Allotted Time Frame

» Just over 1 in 10 practitioners expected this to be their largest challenge, and the reality was consistent with expectations.

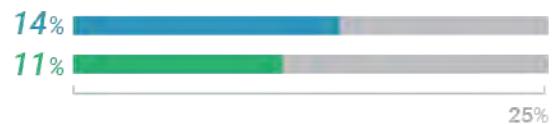

Transitioning from the Old to the New Solution

» In circumstances where legacy or siloed technology is used extensively, the task of moving data and restructuring workflows can be a significant hurdle.

 Expectation
 Reality

Learning How to Use the Technology

» Learning how to use new technology can be a significant burden for treasurers already juggling multiple responsibilities or that have grown accustomed to an older program or interface.

Bank Onboarding

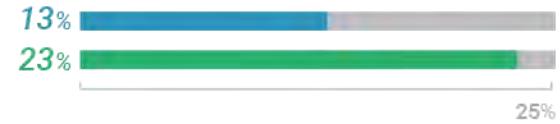

» Due to lengthy and often delayed documentation and testing phases, bank onboarding can be one of the more frustrating steps of an implementation.

Sticking to the Implementation Roadmap

» While delays to the overall project timeframe might occur, the challenge of sticking to the original project roadmap was not nearly as large of an obstacle in reality as practitioners expected.

Effective Communication with the Vendor

» Communicating effectively with the technology vendor was the largest challenge for nearly 1 in 4 firms, almost double the number that anticipated this being the largest challenge ahead of time.

Figure 3

AVOIDING INADEQUATE FUNCTIONALITY

According to a recent Strategic Treasurer survey less than half of organisations with a TMS were using more than 80% of the functionality that they purchased. Admittedly, over 100% were using more than 60% of the functionality they purchased. In many organisations, organisations purchase a TMS module that they plan on using. Even the need to implement a solution that allows them to "grow into" the functionality. When this is used, it may not be effectively mapped to new functionality and, due to the complexity involved with managing a different system to one's TMS, this is not always to their detriment. If a company is paying for the modules and services that are sitting idle, they are losing money and wasting resources. When that same vendor allows users to purchase specific modules of their TMS and add functionality as they need it, there is incentive for companies to have such high levels of unused functionality. To avoid this problem, be intentional and strategic with the functionality you purchase, and if there is a module or service that you feel is unnecessary, don't buy it. You can always add it to your repertoire later on.

As part of a related question, respondents were also asked if there were any modules of their TMS that they were no longer using due to their inefficiencies. Overall, about 70% of respondents reported unneeded issues. At the top of the list were cash forecasting, valuation by bank, risk management, and hedge accounting. In evaluating this data, it is evident that the TMS companies offering some products might need to be strengthened further or enhanced.

Beyond their current state before clients can realize the full TMS value, this data also points toward a lack of innovation and due diligence on the part of organisations that undergo an implementation. You can find many companies purchase unnecessary or redundant functionality in avoiding these types of these issues should have been identified during the RFP process, or during phases of an implementation and delivery before the "go-live" stage.

In order to avoid purchasing inefficient functionality, treasury should continually analyze the TMS solution offered by their chosen vendor during the RFP and testing phases. During these periods, treasury should run their TMS against a number of "what if" scenarios to ensure that each module is functioning in the intended manner. Any deviation from what is normal or expected should be immediately reported to the vendor and IT, and issues should prior to have the issue resolved before the "go-live" stage or the committee pursuing an alternative route.

CORPORATE STRATEGIES TO MAXIMIZE THIS EFFICIENCY

While the implementation of a TMS can prove to be an efficient, effective, and rapid approach to improving the efficiency of their systems, it is often times 80% of organisations who are unable to fully benefit from their TMS. Specifically, the lack of integration and the number of providers indicate that other modules were not working together to best facilitate or promote the implementation.

Q How much of the available TMS functionality that you purchased are you using?

Q What TMS modules or services that you purchased are you not using because they are not working properly or are inefficient? (check all that apply)

MAXIMIZING ROI: SERVICE OPTIONS

As business processes to take on a TMS implementation, one of the first decisions to make involves selecting the personnel to manage the project. For organizations with available company staff that have experience with technology implementations and available time to dedicate to a new project, managing the majority of work in-house may be the most effective strategy. However, not every organization has the bandwidth to manage a full implementation without many business and IT requirements being addressed and delayed. Managing their day-to-day list of responsibilities before a new project is often considered. In these circumstances, it may make more sense to rely on either the technology vendor's project support staff or use the services of a consulting group.

When evaluating the project management services of a TMS vendor, there are several factors to consider. For instance, some vendors maintain a large group of in-house technical consultants and project staff to assist clients with implementations, while other vendors may be limited to the resources they can dedicate to a particular project. Furthermore, some vendors may be undergoing rounds of implementation staff cuts, and their project staff may have to juggle your project with numerous others. This can affect the level and frequency of communication the technology vendor has with the vendor and cause delays when trying to resolve issues. For this reason, it is important for firms to evaluate the size and availability of their chosen vendor's support team early on in the process. And if company feels that additional resources may be required beyond the resources available from the vendor, it could be advantageous to utilize

a third-party consulting group to manage the project. Although hiring a third-party group to assist with the implementation will add an additional expense to the project, most consulting groups that specialize in industry technology will have already managed dozens to hundreds of implementations in the past and are acutely aware of the various challenges that can arise as well as the most effective methods for dealing with them. The leading consultants will also be familiar with a wide array of historical solutions and can assist with developing the most appropriate documentation, training staff, testing system solutions, and getting out of the solution user base while affecting little cost. While it may be difficult for organizations with strict budgetary, they can go a long way in ensuring the project is completed smoothly and efficiently.

TECH IMPLEMENTATION SERVICE OPTIONS

Manage Internally

- Most efficient option, as it increases firm alignment with firm-wide project managers.
- Many finance and IT staff have familiarity with solution and can rely on.
- Many organizations lack the experience or bandwidth to manage an entire implementation on their own.

Rely on Vendor Support Staff

- Many vendors maintain a group of project support staff exclusively assigned to assist with implementations. These professionals are critical for the success of the project.
- Other vendors do not have extensive support staff and come may be lacking in terms of implementation expertise.
- Effective communication with vendors was ranked as the top challenge in implementations by firms surveyed during year in the year.

Outsource to a Consulting Group

- These groups have typically already implemented dozens to hundreds of clients using similar implementations.
- Can provide dedicated personnel that firm is unfamiliar with or does not have the budget.
- Additional costs associated with using third-party may be out of the realm of possibility for organizations with tight budgets.

Treasury Technology by the Data

INDUSTRY USE RATES

At this point in time, the use of treasury software throughout the corporate environment is fairly high. Although significant opportunities remain for small and mid-market firms to find a solution that addresses their needs, the continued "segmentation of technology" with regards to price points and capabilities is having a significant influence on the adoption rates of these markets. However, as of 2010, firms continue to move primarily from implementation with annual revenues in excess of \$1 billion, through a sizable portion of companies in the \$500 million - \$1 billion range have begun using such solutions as well. While cash continues to be used by the majority (90%) of organizations, the use of applications is frequently paired with a more sophisticated solution, such as a TMS or a TPS. According to Strategic Treasurer's 2010 Report Research Tech User Survey, half of corporate treasury departments (50%) were using a treasury management system, and 30% were using an TPS. Among those firms, total turnover (57% of firms) with annual revenues of \$1 billion had a TMS, while just 21% of firms with \$100 million in revenue had one. In a 2007 iteration of this survey, roughly even numbers of firms claimed managed or centralized solutions compared to a local based solution (20% indicated vs. 18% local), although the use of centralized and local based systems was relatively even. It is important to note that the vast majority of new implementations within the past 3 years have been of local based solutions, and it is widely expected that local TMS will be the preferred choice for most organizations in the years to come.

Figure 6

Do you have a treasury system besides Excel?

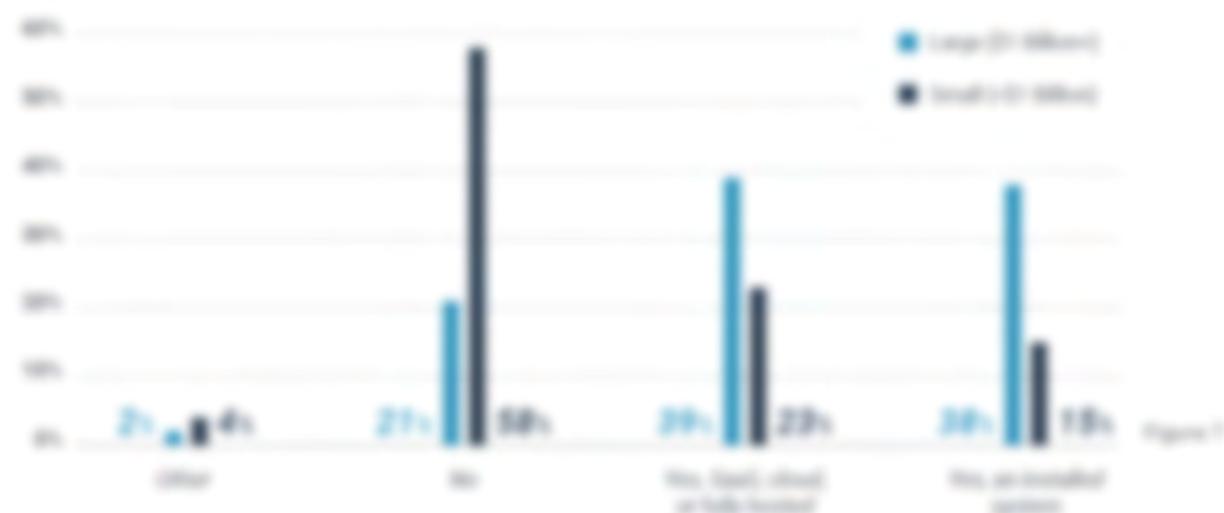

Figure 7

TOP FUNCTIONALITIES REQUIRED

Over the course of the past several decades, the title of "treasurer" has been most commonly linked to the practice of managing and investing assets. And while the funds transfer arena continues to be a core

focus for treasurers, this is not their only area of responsibility. Today most treasury departments are involved with tasks ranging from cash positioning and forecasting to liquidity management, financial risk management, payment processing and reporting, compliance and fraud monitoring, and bank relationship management.

As treasury professionals manage these tasks, the use of technology, particularly TMS or ERP treasury modules, are playing ever increasing roles. Over time, the breadth of functionality offered by these solutions, especially within the TMS arena, has expanded to encompass virtually every facet of treasury operations.

Looking at current TMS usage, a poll conducted as part of a 2017 survey sought to measure the percentage of organizations using specific types of TMS modules. The results showed back up the assertion that cash management requirements (forecasting, forecasting, etc.) and payments

functionality tend to serve as the core features of most TMSs, as these are the services most frequently requested by organizations that leverage such a solution. Beyond these functions, while the 2017 accounting, IT, trading, and risk analysis are often requested by 50-100% of treasury groups, at the lower end of the spectrum, functions related to hedging, settling, and a more limited set of reporting needs by 20-30% of companies. In addition, these requirements, according to Strategic Treasurer's 2017 survey (see highlighted on page 7), offer a realistic view of how TMS functionalities are built out by providers, and how they are leveraged by practitioners.

Q What functions do you use or need in treasury? (% of all users)

TREASURY FUNCTIONS REQUIRED

100% cash management, treasury management, investment management, risk management, and reporting

The survey asked respondents to indicate which of the following functions were required for their organization. The following percentages represent the total number of responses.

Figure 6

NEW TECHNOLOGY PREFERENCES

Cloud Technology

Although mobile banking is widely used, there levels of technology acceptance and usage will be increased during 2014-2015, more focus is now demanded on the concept of "emerging" tech. Indeed, the new technologies that more corporate users desire are as having the most significant impact on business functions and operations, and the way they have been able to deliver better bank services through use of technology. These features are very often related to the nature of the user, the level of complexity of new systems and of their current problems. Companies in certain industries tend to need solutions to be much more user effective and easy to implement, including those represented enterprises in which users are in existing low income and low education. Given the importance of mobile cloud applications and the broad range of opportunities they offer, treasury users tend to think the overall impact of these solutions is more significant than other emerging or "emerging" tech.

Mobile Banking Apps

In 2013, when banks were asked how important they considered commercial mobile banking applications would be for their corporate clients over the next two to three years, 50% believed such apps would be important or extremely important, and not a single respondent has been actively implementing these solutions. Banks are clearly acknowledging the need of mobile-based and growth in the commercial mobile banking sector. However, when respondents were asked how mobile banking applications would be for their companies over the same timeframe, just 20% see such developments as important. Indeed, 20% view them as unimportant and the majority (50%) were unsure. When it comes to mobile devices, consumers have commonly shown that security is a major concern, and many are worried by the potential threat that mobile solutions to their payment and banking operations. The good news here is that 30% of corporate indicated their satisfaction with mobile payments has increased over the past year, compared to just 10% whose confidence had decreased.

Blockchain or API?

When it comes to the use of new models of APIs and blockchain in payment operations, over half believe no major improvements are forthcoming in longer term. While a significant portion (50%) of respondents believe nothing needs to be done, 20% believe APIs will continue to evolve, while only 10% believe blockchain will take precedence. The APIs are clearly seen as a key tool for mobile banking, and the use of APIs is expected to grow over the coming years. The introduction of the mobile payment system (MPS) and the creation of an "open banking" environment. Due to this new direction, APIs look to play a key role in connecting consumers between bank accounts and those of other providers in order to facilitate such access. APIs are also deemed a component of future financial solutions, and given the rapid growth, they will likely continue to see greater use. On the other hand, blockchain, while it does not represent any significant innovation, has yet yet been to the top of consumers' technology preferences.

Q **Corporate offices of the following disruptions do you see as having the greatest impact on treasury functions & payments in the next 2-3 years?**

Figure 10

Q **Corporate offices in the next three years, how important will commercial mobile banking applications be for your position?**

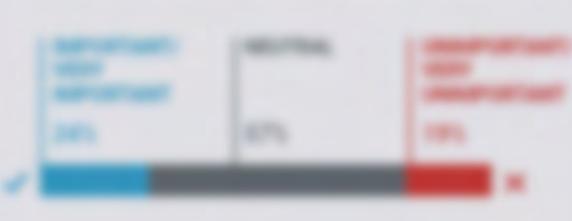

Figure 11

Q **Corporate offices is more important for your sufficient payments?**

WHAT MATTERS MOST WHEN SELECTING A TMS?

In a 2010 survey, Strategic Business polled practitioners that used a TMS to evaluate the three areas (out of a list of eight) that were most important for them when selecting treasury software. The point of emphasis here was to determine which elements of a TMS the cost base of new treasury controls, which were most important to practitioners as they evaluated different providers and ultimately selected a provider. The results cast an interesting picture as to the state of the market and what measures are looking for in their technology. In terms of

bank security was the area that mattered most, followed by bank function integration, ease of use, and automation efficiency. After these elements, there was a significant drop off in importance as factors such as user visibility, cost of the solution, and quality of the provider ranked much lower.

While this data does provide a clear picture as to the areas of technology that practitioners focus on when making investment decisions, there are also some elements of this data that have proven misleading. For instance, the 2010 survey Strategic Business has reported on previously indicate that companies put a much greater emphasis on the quality of each provider than what is highlighted

here. In fact, some companies choose to entirely eliminate some vendors out of their shortlist based exclusively on their position within the market. One specific vendor may be eliminated to those on large national networks; however, provided that each vendor being evaluated has a similar position within the market, then the elements of security, compatibility, and automation efficiency are what ultimately differentiate one solution from the next. But in situations where analysis of these elements fails to determine a clear favorite or other firms are operating with high budgets, practitioners often turn to cost as the final point of reference for selecting their TMS of choice.

Which of the following represent your most important considerations when evaluating treasury software? (Please Select 3 Choices)

Figure 10

TABLE 1: In 2010, financial control activity has continued to change. In the treasury management 2010 survey, firms indicated bank compatibility, automation, and integration were the most important factors for cost. These factors clearly are the focus of practitioners' needs as they continue to evaluate new forms of treasury software.

TABLE 2: Increasingly, the cost of a TMS is becoming the primary consideration for many firms. This can be due to the fact that there is currently a wide range of TMS offerings at various price points, depending on the complexity of the software.

TABLE 3: Although practitioners' concern for bank security and the quality of their solution are still other factors that should not be discounted, the user visibility and ease of use of the software are becoming more important factors in the selection of new software purchased in the market.

Questions to Ask a Vendor

DOES THE VENDOR OFFER THE SUPPORT LEVEL WE DESIRE?

Having vendor offerings that provide range from standard solutions found online at the client's disposal to custom-built solutions based on the client's needs and requirements is always through an online portal. To avoid IT departmental conflicts, it's best to determine which vendor offers a majority of support before going to select their solution. However, it's better to work with a company that can provide a range of services, such as professional services, consulting, training, and support, in addition to a range of products, such as software licenses. This will ensure that your organization can find a vendor that can offer you preferred support options.

WHAT IS THE FULL SCOPE OF CUSTOMIZABILITY OFFERED BY THE VENDOR?

Each particular vendor solution provides its own built-in a unique set of capabilities and strengths, with one vendor may be designed to provide certain features and functionality another might specialize in risk management. While some may offer one tool, others offer multiple and interconnected tools that allow for a full suite of solutions. As such, it's important to determine the extent and nature of your business goals against the capabilities of any potential solution to ensure that they are capable of providing the type and level of service you need to support now and into the future.

DOES THE VENDOR'S INDUSTRY POSITION ALIGN WITH OUR PRIORITIES & REQUIREMENTS?

Consider the ideal company profile of the vendor you would like to do business with, such as their experience, number of clients, annual growth rate, and projected product roadmap. Would you prefer a larger vendor with an established customer base or a smaller vendor that can offer a greater degree of flexibility and customization? Do these vendors offer integrated platforms with extensive history of mergers, acquisitions, and financing activities to determine whether it's likely that any significant company changes or restructuring will occur in the near future.

WHAT FINANCIAL OPTIONS WILL BE AVAILABLE FOR OUR TREASURY SUPPORT?

While practically every TMS vendor offers educational and training opportunities to clients, the content through which these offerings are delivered can vary substantially. Some vendors may provide online training courses that clients can access and take at their own pace, while others may offer in-person training that is conducted in person at the client's location. Additionally, many vendors will offer several financial options where clients can learn about financing options, such as leases with other users, and finance fee and when an item is taken off the books, such as a warranty.

WHAT ELEMENTS OF A TMS IMPLEMENTATION WILL REQUIRE FROM IT DEPARTMENT'S INVOLVEMENT?

The vendor's implementation often needs to integrate a TMS to its Business Rule Repository or CR system. This implementation can be a complex process involving multiple parties. Therefore, understanding up front what will be required of your IT department during the implementation will allow you to plan the necessary internal resources and available expertise well for the implementation. As for the client's ongoing use, after initial implementation, a vendor's support team must understand how the client's IT organization is structured to determine solutions or select a vendor with limited technical staff, you may be forced to rely on lower degrees of internal IT assistance.

HOW ARE SYSTEM UPDATES, UPDATES, & MAINTENANCE RESOURCES HANDLED?

Depending on the size and growth prospects of the vendor, updates to the solution can have significant time delays to users for new developments. These updates will result in temporary unavailability of the TMS. In addition, vendor service requests submitted to the vendor may be handled directly by both vendor staff and their third-party partners. There's also a possibility of being given a "backdoor" access to handle certain tasks, when vendors may contract the vendor to provide the level of service. Thus, understanding the responsibilities the vendor's customer service division and system update schedule is pivotal for determining how they will be able to serve your organization.

A Deeper Dive Into the Data

As Strategic Treasurer evaluates the treasury technology landscape and analyzes the various operational preferences, perspectives, and challenges associated with the practice of treasury, we rely extensively on our own industry research. Since 2009, our analysts have worked hard to develop a comprehensive market research program, and today, the insights captured through our 10+ annual surveys serve as the cornerstone for the publications and resources we develop. For institutions, fintechs, or corporates interested in learning more about our market research, the below resources offer a deeper dive into the key findings we have obtained over the course of the past year.

2018 TREASURY FRAUD & CONTROLS SURVEY REPORT

Offers comprehensive analysis of treasury's experiences with specific types of fraud and evaluates the security tools and methods used by organizations to protect their financial assets and information.

2017 TREASURY PERSPECTIVES SURVEY REPORT

Gauges practitioners' viewpoints, strategies, and preferences on a range of topics including economic growth, compliance, security, payments, capital markets, risk, and technology use.

2018 B2B PAYMENTS & WCM STRATEGIES SURVEY REPORT

Analyzes the use of specific types of payment formats and channels, preferences for new and emerging payment technologies, and the unique strategies deployed by firms for managing working capital and liquidity.

TREASURY INSIGHTS BENCHMARK REPORTS

New in 2018, our Treasury Insights resource offers exhaustive insights across all our industry surveys, with breakouts available by company size and other metrics. For more information regarding this resource, click [here](#) to download the brochure.

FOR MORE INFORMATION

For additional information regarding any of our survey results publications, webinars, and infographics, you can visit the "survey" section of our website at www.strategictreasurer.com to access a complete list of resources. To learn more about our Treasury Insights resource, visit our website to download the brochure at www.strategictreasurer.com/benchmarking.

Strategic Treasurer Market Research

As part of our ongoing market research initiatives, Strategic Treasurer conducts 10 industry surveys every year on a variety of topics ranging from cash management and payments to fraud and compliance. These surveys are collectively completed by several thousand corporate, banking, non-profit, government, and higher education respondents every year. Below is a list of our current industry research initiatives.

Treasury Fraud & Controls

Offers comprehensive analysis of treasury's experiences with specific types of fraud and evaluates the security tools and methods used by organizations to protect their financial assets and information.

Treasury Perspectives

Gauges practitioners' viewpoints, strategies, and preferences on a range of topics including economic growth, compliance, security, payments, capital markets, risk, and technology use.

B2B Payments & WCM Strategies

Analyzes the use of specific types of payment formats and channels, preferences for new and emerging payment technologies, and the unique strategies deployed by firms for managing working capital and liquidity.

Global Payments

Studies the various payment technologies, tools, and services used by organizations for facilitating global payments activity and analyzes the key areas of complexity currently impacting the payments landscape.

Treasury Compliance

Keeps track of treasury's shifting strategies and responsibilities for managing bank account information and maintaining compliance across the full scope of their daily operations.

Liquidity Risk

Analyzes organizations' short-term investment and risk management strategies to uncover trends related to how firms are optimizing their liquid assets and identifying and mitigating associated risks.

Supply Chain Finance

Evaluates the use of SCF technology within the corporate environment, as well as the strategies and technologies put in place by firms to manage vendor relationships, streamline cash conversion cycles, and optimize working capital.

Cash Forecasting & Visibility

Studies the operational and technological components deployed by organizations for maintaining visibility to cash positions and forecasting cash flows.

Higher Education

Focuses specifically on understanding the unique challenges and operations of financial personnel within the realm of higher education and how their experiences compare to their peers in the corporate environment.

Treasury Technology Use

Analyzes the use of technology within the treasury environment, with a focus on the utilization of Treasury Management Systems (TMS) and organizations' unique experiences with implementing, using, and upgrading these solutions.

How are your surveys classified?

The surveys highlighted on the left-hand side of this page comprise Strategic Treasurer's Premier Survey program, which offers comprehensive analysis (100+ questions) across each area of focus. The surveys highlighted directly above are part of our Standard Survey program, which provides robust coverage (30-50 questions) of the selected topic. To learn more about our market research initiatives, visit our website at strategictreasurer.com/surveys.

TECHNOLOGY IMPLEMENTATIONS

Strategic Treasurer ensures maximized investments by:

- » Developing and leading the vendor selection process to ensure you select the "best-fit" solution.
- » Creating a realistic project roadmap that contemplates the unique requirements of your organization.
- » Managing the implementation from design, project kick-off, bank onboarding, and testing, through go-live and post-project analysis.
